

Raw transit-RV differences reflect selected planet populations; the method indicator adds no skill

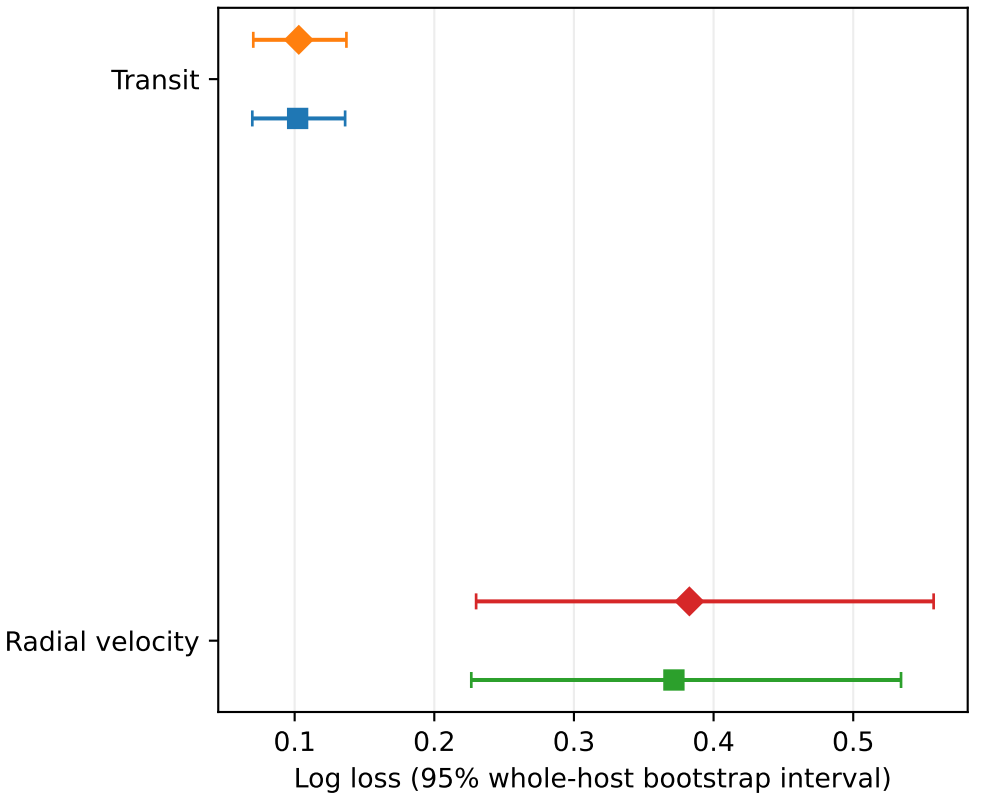

A. Physical covariates reproduce the raw method difference

B. Ranking performance

C. Probabilistic performance

Adjusted RV/transit odds ratio: 0.94 [0.30, 2.38]
Standardized probability difference: -0.003 [-0.044, +0.043]

Only transit and radial-velocity planets have reported-flux labels. Discovery method enters as one standardized, ridge-shrunk intercept contrast; no imaging coefficient and no method-specific slope is estimated.
