

Chunk 6 – Constrained random forest under repeated host-grouped validation

Core cohort: 366 planets, 264 hosts, 26 HZ-positive hosts. Points and bars use repeated out-of-host predictions and 95% whole-host bootstrap intervals.
Thresholded metrics use training-only nested thresholds; PR-AUC and log-loss are threshold-free. Configuration choice uses the simplest model within one standard error of the best inner log-loss.
